

03_ARCHITECTURE & REPLAY DEMO

GUIDE: Aura-Guard v1.3

Subject: Visualizing the Supply Chain of Trust

1. Visual Architecture: The Supply Chain of Trust

When presenting the architecture diagram (02_ARCHITECTURE_DIAGRAM.png), focus on the flow of integrity rather than just the flow of data. The diagram should illustrate three distinct zones:

Zone	Color Code	Key Message
Input Layer	Green	The "Untrusted" AI interaction (Prompt + Response).
Aura-Guard Core	Gold	The Deterministic Engine that "washes" and evaluates the input using signed policies.
Evidence Store	Deep Blue	The Immutable Audit Log where every entry is cryptographically chained.

2. The "Replay" Demo: Scripted Proof

The goal of the demo is to move from "Trust us" to "Verify us." Use the following steps to demonstrate the system's power in under 5 minutes:

Step 1: The "Happy Path" Audit

1. Send a valid request to the /v1/audit endpoint.
2. Show the JSON response: "decision": "ALLOW" and the chain_hash.
3. Show the entry appearing in logs/audit.jsonl.

Step 2: Tamper Detection (The Killer Feature)

1. Open logs/audit.jsonl in a text editor.
2. Manually change one letter in a previous "DENY" decision to "ALLOW". Save the file.
3. Run the aura-replay tool.
4. **Result:** The tool should immediately trigger a CHAIN BREAK DETECTED error. This proves that any attempt to rewrite history is mathematically impossible to hide.

Step 3: Policy Integrity Demo

1. Modify a rule in policies/finance-v1.yaml without updating the .sig file.

2. Attempt to restart Aura-Guard or reload the policy.
3. **Result:** The system should return a PolicyVerification error and fail-closed. This proves that admins cannot silently weaken security rules.

3. Key Talking Points for the Demo

- "Aura-Guard doesn't just log; it generates **mathematical evidence**."
- "We treat AI compliance with the same rigor as a **banking ledger**."
- "This is **Atom-Grade Trust**: deterministic, reproducible, and immutable."

"Trust but Verify — with Aura-Guard, Verification is Automatic."
